Special Problem 9a

Please calculate the heat of combustion of propane (g) at 25°C, 1000°C, and at 2000°C using (a) the method using the path method and the heat of reaction at 25°C, and (b) the method using ΔH_f° and the enthalpy of each species at the final temperature. Assume that the H₂O formed is in the gas phase. Please use either Excel, Python, or Mathcad.
